

Supplementary Figure 2. Kaplan-Meier curves comparing 90-day survival among patients hospitalized with COVID-19, by prophylactic anticoagulation status at discharge. Group 1 was prescribed prophylactic anticoagulation for venous thromboembolism prevention, whereas group 2 was not prescribed prophylactic anticoagulation. Significant differences in survival at 90-days post-discharge are noted ($p < 0.0001$), favoring patients that were prescribed prophylactic anticoagulation at discharge.
